ABSTRACT

A method and apparatus for printing documents on a networked system. The method includes creating at least one print job associated with a user identification code, sending the at least one job to a print queue and separately conveying the user identification code to a printing device. This method could be accomplished either with a tag system or by direct data entry at the site of a printing device. The device then obtains and prints the at least one job associated with the user identification code from the print queue.
